

7. A system comprising:

a plurality of agents;

an external non-dedicated shared memory block accessible by each of said plurality of agents, said external non-dedicated shared memory block including a plurality of memory banks;

a register adapted to partition said external non-dedicated shared memory block into a plurality of partitions each of said plurality of partitions being accessible by a unique group of said plurality of agents; and

said plurality of partitions each comprise a number of said plurality of memory banks;

wherein said plurality of agents have clock signal representations of a base clock signal.

13. A system for providing access to shared external non-dedicated memory, said system comprising:

a first agent to provide a memory access clock signal to allow said first agent to access said shared external non-dedicated memory; and

a second agent to provide a representation of said memory access clock signal to access said shared external non-dedicated memory in synchronism with said access by said first agent to said shared external non-dedicated memory;

wherein each of said first agent and said second agent access different portions of said shared external non-dedicated memory simultaneously.

17. A method of synchronizing access from a plurality of agents to external non-dedicated shared memory, comprising:

providing a memory access clock signal;

providing a representation of said memory access clock signal in synchronism with said memory access clock signal;

firstly accessing a portion of said external non-dedicated shared memory from a first agent based on said memory access clock signal;

secondly accessing a portion of said external non-dedicated shared memory from a second agent based on said representation of said memory access clock signal;

wherein said step of secondly accessing said external non-dedicated shared memory follows said step of firstly accessing without a wait state therebetween.

20. A method of partitioning an external non-dedicated shared memory, comprising:

setting a configuration register to partition said external non-dedicated shared memory into a first plurality of memory banks and a second plurality of memory banks;

accessing said first plurality of memory banks from a first agent;

accessing said second plurality of memory banks from a second agent; and

re-partitioning said external non-dedicated shared memory on-the-fly;

wherein said second agent receives a clock signal representation of said first agent's clock signal.

Version with Markings to Show Changes Made

C 1 Sub F1

1. (Twice Amended) A system comprising:
an external non-dedicated memory including a plurality of memory banks;
a first agent having a clock signal adapted to access a first memory portion including a first number of said plurality of memory banks; and
a second agent having a clock signal representation of said first agent's clock signal adapted to access a second memory portion including a second number of said plurality of memory banks;
said first number and said second number being variable.

C 2 Sub E1

2. (Three Times Amended) A system comprising:
a plurality of agents;
an external non-dedicated shared memory block accessible by each of said plurality of agents, said external non-dedicated shared memory block including a plurality of memory banks;
a register adapted to partition said external non-dedicated shared memory block into a plurality of partitions each of said plurality of partitions being accessible by a unique group of said plurality of agents; and
said plurality of partitions each comprise a number of said plurality of memory banks;
wherein said plurality of agents have clock signal representations of a base clock signal.

C3 Sub F-1 > 13. (Twice Amended) A system for providing access to shared external non-dedicated memory, said system comprising:

a first agent to provide a memory access clock signal to allow said first agent to access said shared external non-dedicated memory; and

a second agent to provide a representation of said memory access clock signal to access said shared external non-dedicated memory in synchronism with said access by said first agent to said shared external non-dedicated memory;

wherein each of said first agent and said second agent access different portions of said shared external non-dedicated memory simultaneously.

C4 Sub > 17. (Twice Amended) A method of synchronizing access from a plurality of agents to external non-dedicated shared memory, comprising:

providing a memory access clock signal;

providing a representation of said memory access clock signal in synchronism with said memory access clock signal;

firstly accessing a portion of said external non-dedicated shared memory from a first agent based on said memory access clock signal;

secondly accessing a portion of said external non-dedicated shared memory from a second agent based on said representation of said memory access clock signal;

wherein said step of secondly accessing said external non-dedicated shared memory follows said step of firstly accessing without a wait state therebetween.

C5 *Sec 1* 20. (Twice Amended) A method of partitioning an external non-dedicated shared memory, comprising:

setting a configuration register to partition said external non-dedicated shared memory into a first plurality of memory banks and a second plurality of memory banks;

accessing said first plurality of memory banks from a first agent;

accessing said second plurality of memory banks from a second agent; and

re-partitioning said external non-dedicated shared memory on-the-fly;

wherein said second agent receives a clock signal representation of said first agent's clock signal.
